

In the Claims:

Please amend the claims as follows:

1-8 (cancelled)

9. (currently amended) An implant device for a bone anchored hearing aid, comprising:
a pre-mounted unit comprising a screw-shaped anchoring fixture configured to be
anchored in bone tissue, tissue;
an abutment sleeve configured to penetrate skin and comprising a tool engaging portion,
and a screw connecting the abutment sleeve to the fixture, wherein the tool engaging portion of
the abutment sleeve comprises a plurality of symmetrically arranged recesses or holes; and
a tool configured to install the entire pre-mounted unit into the bone tissue in one step,
wherein the tool is configured to cooperate with the tool engaging portion of the abutment sleeve
when installing the implant into the bone tissue, and wherein the tool comprises a plurality of
spikes configured to cooperate with the recesses or holes in the abutment sleeve during
installation and tightening of the implant unit.

10. (previously presented) The implant device according to claim 9, wherein the fixture
comprises self-tapping edges and a flange operative as a stop when the fixture is installed in the
bone tissue.

11. (cancelled)

12. (cancelled)

13. (currently amended) The implant device according to claim 9, wherein the tool comprises a first connecting part ~~econfigured~~ adapted to engage a machine driver to install the implant device and a second connecting part for manual insertion of the implant device.

14. (previously presented) The implant device according to claim 9, wherein the tool comprises a resilient ring configured to cooperate with an edge of the abutment sleeve to provide a lifting function.

15. (currently amended) The implant device according to claim 14, further comprising:
a sterile package configured to contain the implant device; and
a titanium packaging sleeve configured to retain the implant device in a predetermined position in the sterile package, wherein after opening the plastic sterile package the implant device is configured to be separated from the titanium packaging sleeve with the tool and the lifting function.

16. (currently amended) The implant device according to claim 15, wherein the sterile package comprises a package portion and a lid portion, the package portion comprising a sealing ring configured to provide a tightening between the package portion and the lid portion.

17. (currently amended) The implant device according to claim 16, wherein the sterile

package is made of plastic.

18. (currently amended) The implant device according to claim 16, wherein the sterile package comprises a cylindrical outer surface.

19. (currently amended) The implant device according to claim 16, wherein the sealing ring is arranged on an outer surface of the sterile package.

20. (previously presented) The implant device according to claim 16, wherein the package portion and lid portion comprise a screw connection.

21. (previously presented) The implant device according to claim 16, wherein the sealing ring is adjustable in a longitudinal direction to provide tightening for different positions of the lid portion on the package portion.
